STEFAN BOSSE - DETECTION OF HIDDEN DAMAGES IN FIBRE LAMINATES USING LOW-QUALITY TRANSMISSION X-RAY IMAGING, X-RAY DATA AUGMENTATION BY SIMULATION, AND MACHINE LEARNING

3

# INTRODUCTION

- Spatially resolved Inspection and Testing of structures requires **image-based measuring methods**

- **Non-destructive testing** (NDT) of metal-based structures can exploit different imaging methods, mainly:

  - **X-ray** Radiography (single projection) and Computer Tomography (CT, multi-projection)

  - Guided **Ultrasonic Waves** (GUW) and Ultrasonic Sonography

- Homogeneous as well as Composite Materials can be tested, but reflection and diffraction can have a significant impact on image quality!

- **Detection of hidden damages, defects, and impurities (e.g., pores) is still a challenge**!
> **ⓘ Primary Goal. Automated Damage, Defect, and Impurity Detection in materials and structures including composites using single X-ray projection images (from LowQ/MidQ devices) and data-driven feature marking models (Convolutional Neural Networks).**

Universität Bremen

STEFAN BOSSE - DETECTION OF HIDDEN DAMAGES IN FIBRE LAMINATES USING LOW-QUALITY TRANSMISSION X-RAY IMAGING, X-RAY DATA AUGMENTATION BY SIMULATION, AND MACHINE LEARNING

4

# INTRODUCTION

**Different specimens, structure geometries, materials, and defects are considered in this work! They pose different coincidence between material and image features.**

1. **Homogeneous aluminum die casting plates (150x40 mm) with gas pore defects**

2. **Composite Fibre Metal Laminate plates (FML, aluminum and PREG layers, 50 x 50 mm) with impact damages posing layer delaminations, deformation, cracks, and kissing bond defects.**

**Secondary Goal. Migration from laboratory (HighQ/MidQ) to in-field (LowQ) measuring techniques and devices.**

Universität Bremen

STEFAN BOSSE DETECTION OF HIDDEN DAMAGES IN FIBRE LAMINATES USING LOW-QUALITY TRANSMISSION X-RAY IMAGING, X-RAY DATA AUGMENTATION BY SIMULATION, AND MACHINE LEARNING
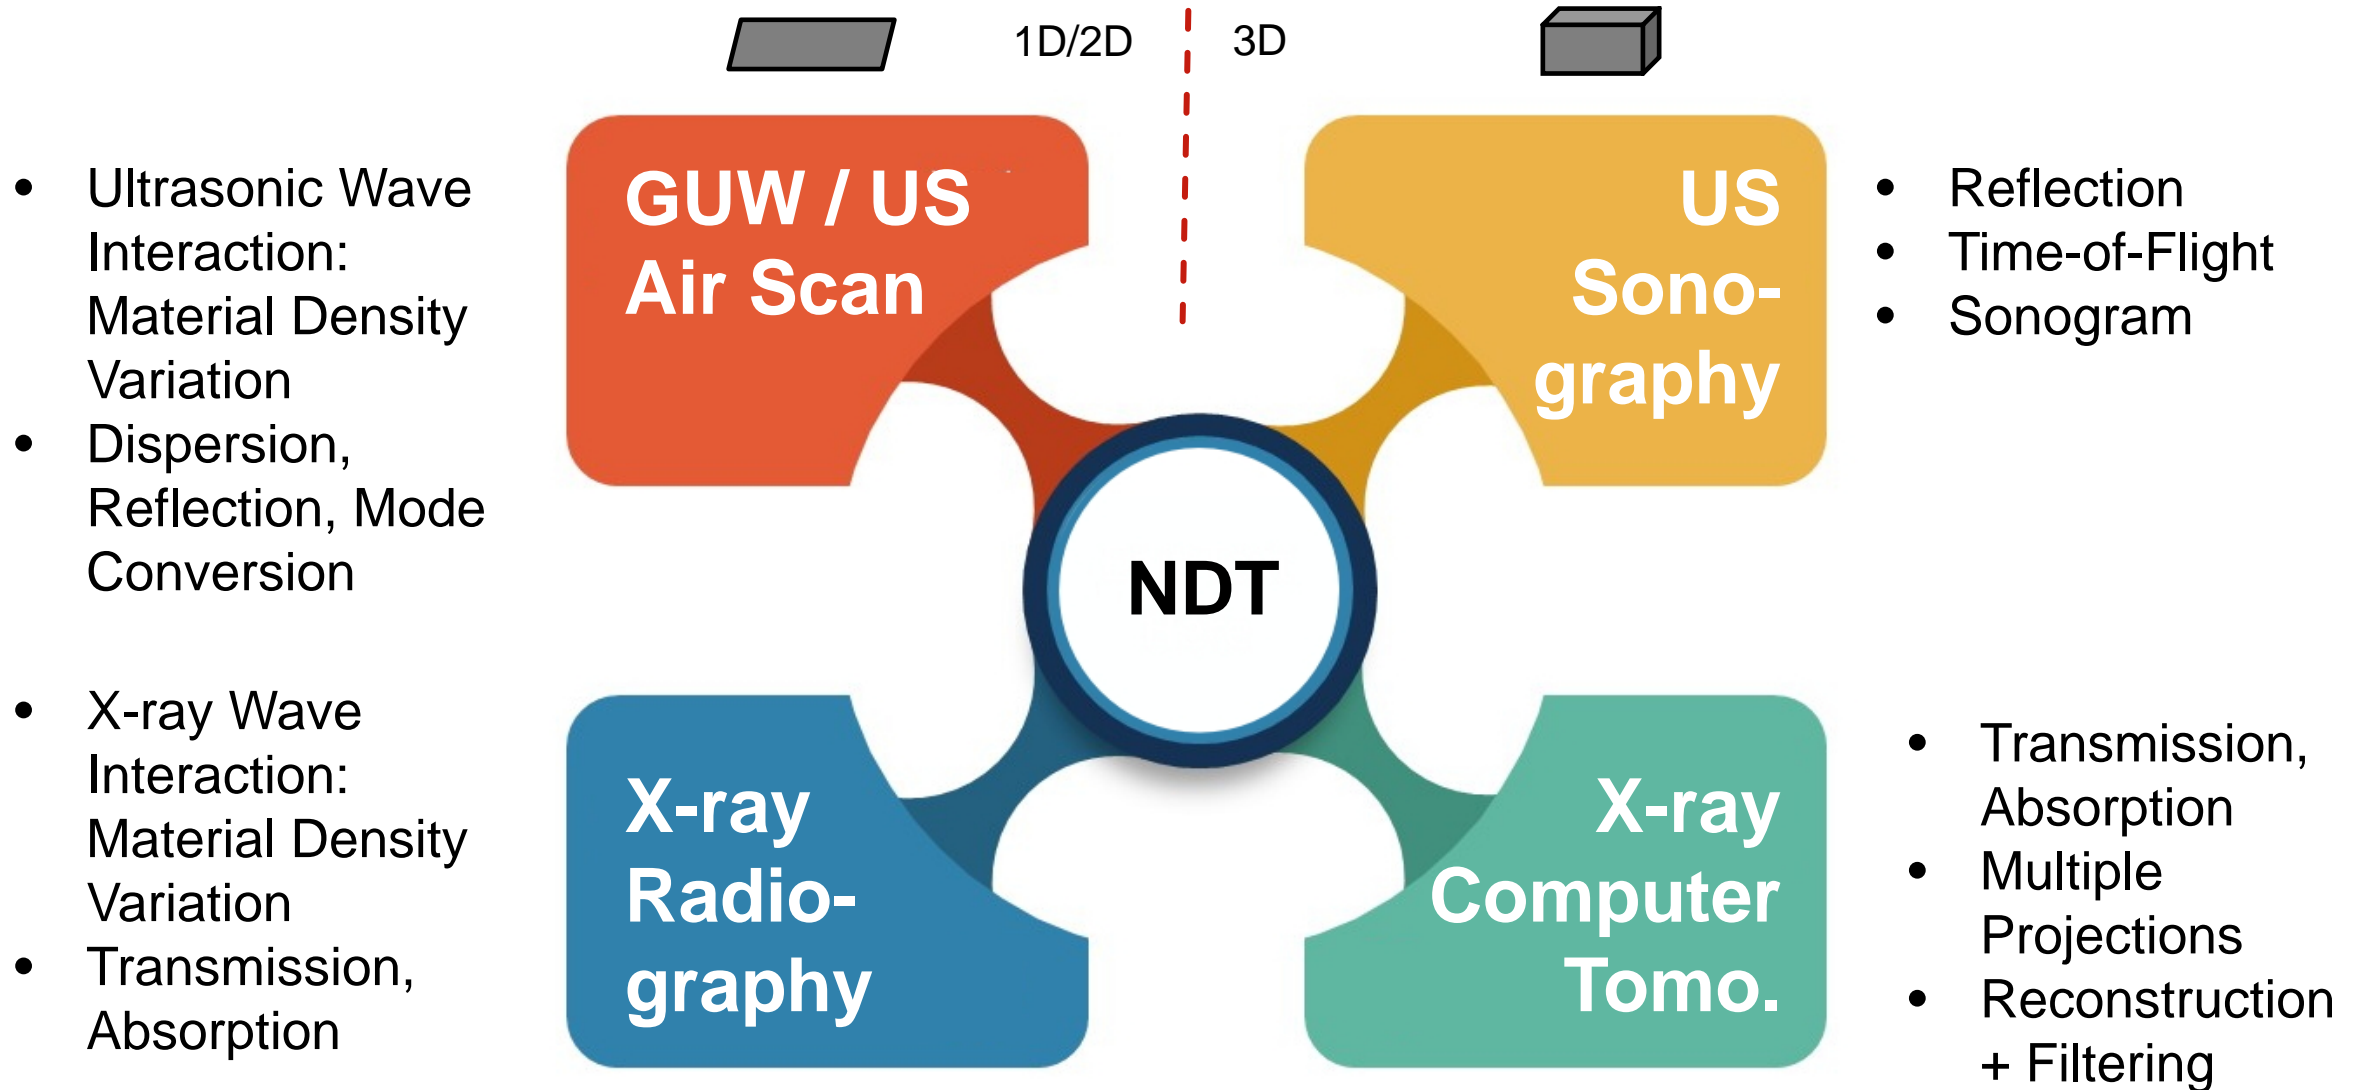

5

# INTRODUCTION

- Feature detection and marking in measuring images can occur on different levels:
  - **Region-of-Interest Search**
  - **Feature Maps**
  - **Damage and defect classification**
  - **Damage and defect localisation**
  - **Global statistical aggregates (e.g., pore density, distribution)**
- Either classical numerical and model-based algorithms (e.g., edge detection using a Soebel filter or Canny detectors) or data-driven models are used for feature marking („Machine Learning")

> ⚠️ **Data-driven models require data! Data must contain a sufficient statistical variance and distribution of features to be detected. That's the first issue with most engineering data! Additionally, supervised data modelling requires accurately labelled strong feature examples, commonly not available, and being the second issue and downfall in data-driven modelling.**

**X-ray Computer Tomo.**

- Transmission, Absorption
- Multiple Projections
- Reconstruction + Filtering

# GUW/US VERSA X-RAY RADIOGRAPHY/CT

- X-ray images can be simulated with high accuracy with respect to real measured images[1]

- X-ray images enable direct interpretation and feature* detection (e.g., damages), but, not all features are directly visible and need to be intensified (contrast/SNR by algorithms)

- Ultrasonic signals cannot be simulated with high accuracy with respect to real measured images; there is a large reality gap!

- Features* are hard to be detected directly, advanced filtering and complex feature extraction models are required.

# KEY RESULTS AND CHALLENGES

**Specimens**:

1. Aluminum die casted plates with pores, Fraunhofer IFAM Bremen (Dirk Lehmhus)
2. GLARE Fibre Metal Laminate plates (5 layers) with impact damages , DFG research group 3022 (Bremen, Hamburg, Braunschweig, Siegen)

**Objectives** (Hypothesis: Can the goal be reached with the proposed method and data?)

1. Pore detection (feature marking) from single frontal LowQ X-ray projections using a Convolutional Neural Network
2. Damage or anomaly feature marking in 3D CT reconstructed HighQ image volumes using a Convolutional Neural Network

**Measurements**

1. MidQ X-ray (IFAM), single and multi-projection images (CT, 400/800 projections) 60 kV, 2 mA, 1000 x 1000 pix. SSD, 200μm LowQ X-ray (Bosse), single projection images, 55 kV, 1mA, 1920 x 1080 pix, Imaging detector with CMOS sensor, 40 μm
2. HighQ X-ray (Zeiss Xradia μCT) multi-projection images (CT, 800 projections), 110 kV, 1 mA, 2000 x 2000 pix. SSD, 20 μm

29

# X-RAY SIMULATION

- **Input**: Polygon mesh grid (STL, Stereolithography file format) model
  - An STL file describes a raw, unstructured triangulated surface
  - Decomposition of multi-material structures in single density parts (finally merged in simulator)
  - 3D Model design: Constructive Solid Geometry (CSG)
- **Output**: X-ray intensity image with a specific detector resolution (number of pixels) and pixel size, floating point or integer data format (at least 16 Bits)
- Spatial source, object, and detector geometries can be fully parametrized including rotatated planes
- **Core software library**: gvxr / gVirtualXray using GPU computations and the OpenGL Shading Language (faster than 1ms / image)
  - https://gvirtualxray.fpvidal.net/
  - Based on the **Beer-Lambert law to compute the absorption of light** (i.e. photons) by 3D objects (here polygon meshes).

# X-RAY SIMULATION

- C++ simulation library gvxr/gVirtualXray[1]

- Integrated in own simulator program XraySim:
  https://github.com/bslab/xraysim

- GPU/OpenGL Ray tracing using Beer-Lambert law

- Attentuation along direct transmission path from
  source to detector – no scattering and reflection

"I(x,y) is the integrated energy in eV received by pixel (x,y). In the polychromatic case, the beam spectrum is discretised in several energy channels. $E_i$ corresponds to the energy in eV of the i-th energy channel. $D(E_i)$ is the number of photons emitted by the source at that energy $E_i$. The detector response $R(E_i)$ mimics the use of a scintillator by replacing the incident energy $E_i$ with a smaller value, i.e. $R(E_i) < E_I$. $\mu_j(E_i)$ is the linear attenuation coefficient of the j-th material at energy $E_i$. $d_j(x,y)$ is the path length."
$$\mathbf{I}(x,y) = \sum_i \mathbf{R}(E_i)\,\mathbf{D}(E_i)\,\exp\left(-\sum_j \mu_j(E_i)\,\mathbf{d}_j(x,y)\right)$$
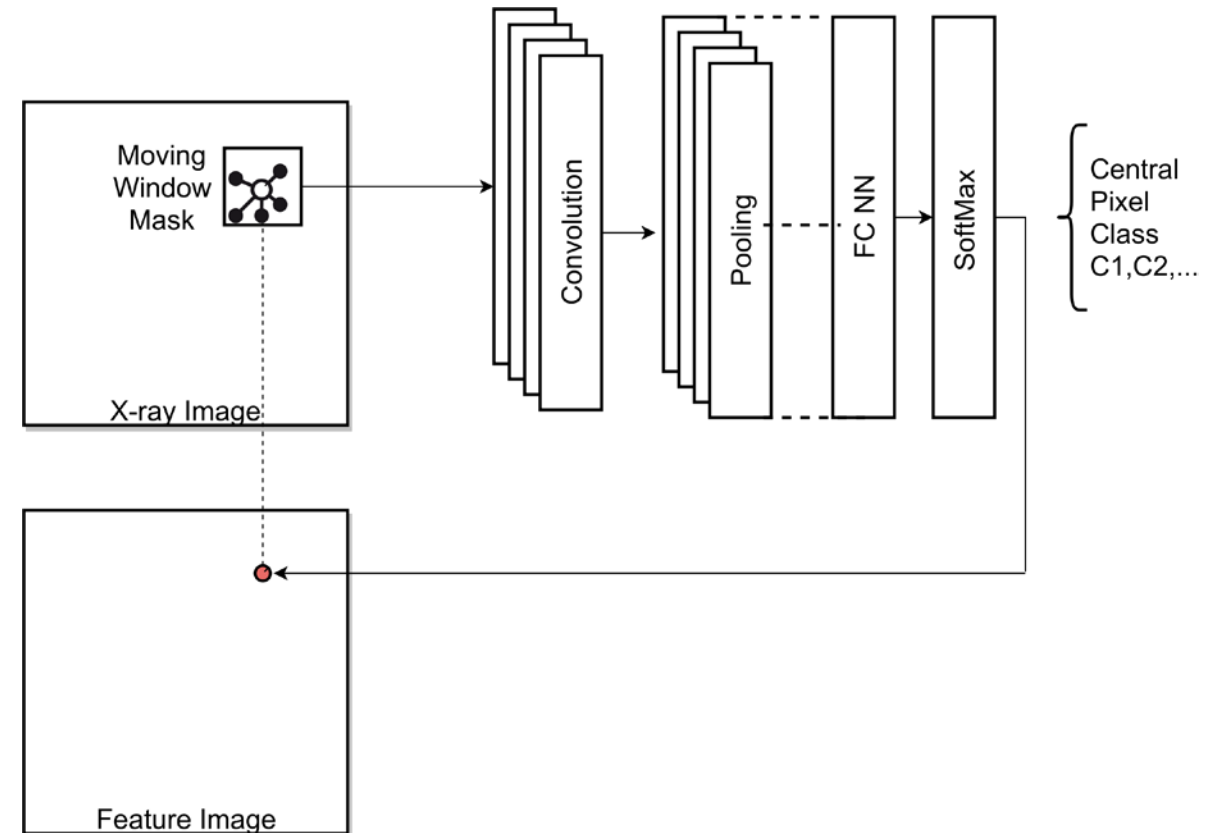

[1] Simulation of X-ray projections on GPU: Benchmarking gVirtualXray with clinically realistic phantoms, Jamie Lea Pointon, Tianci Wen, Jenna Tugwell-Allsup, Aaron Sújar, Jean Michel Létang, and Franck Patrick Vidal Computer Methods and Programs in Biomedicine, 2023.....

33

# SEMANTIC CNN PIXEL CLASSIFIER

- **Input**: A sub-window of an X-ray image

- **Output**: The object class to which the central pixel of the window belongs

- The CNN classifier is applied to all pixels of an input images and produces an equally sized feature marking output image

- Point clustering (e.g., using DBSCAN) can be used to extract list of geometric objects (pores, damages, …)

STEFAN BOSSE - DETECTION OF HIDDEN DAMAGES IN FIBRE LAMINATES USING LOW-QUALITY TRANSMISSION X-RAY IMAGING, X-RAY DATA AUGMENTATION BY SIMULATION, AND MACHINE LEARNING
34

Universität Bremen

# ANOMALY DETECTION IN FML CT DATA

- Goal: Find (mark) damages (deformation, cracks, delaminations) in 3D CT volumes

- Method: Z-Slicing of 3D CT volumes and application of an anomaly detector to z-profiled slices

STEFAN BOSSE - DETECTION OF HIDDEN DAMAGES IN FIBRE LAMINATES USING LOW-QUALITY TRANSMISSION X-RAY IMAGING, X-RAY DATA AUGMENTATION BY SIMULATION, AND MACHINE LEARNING
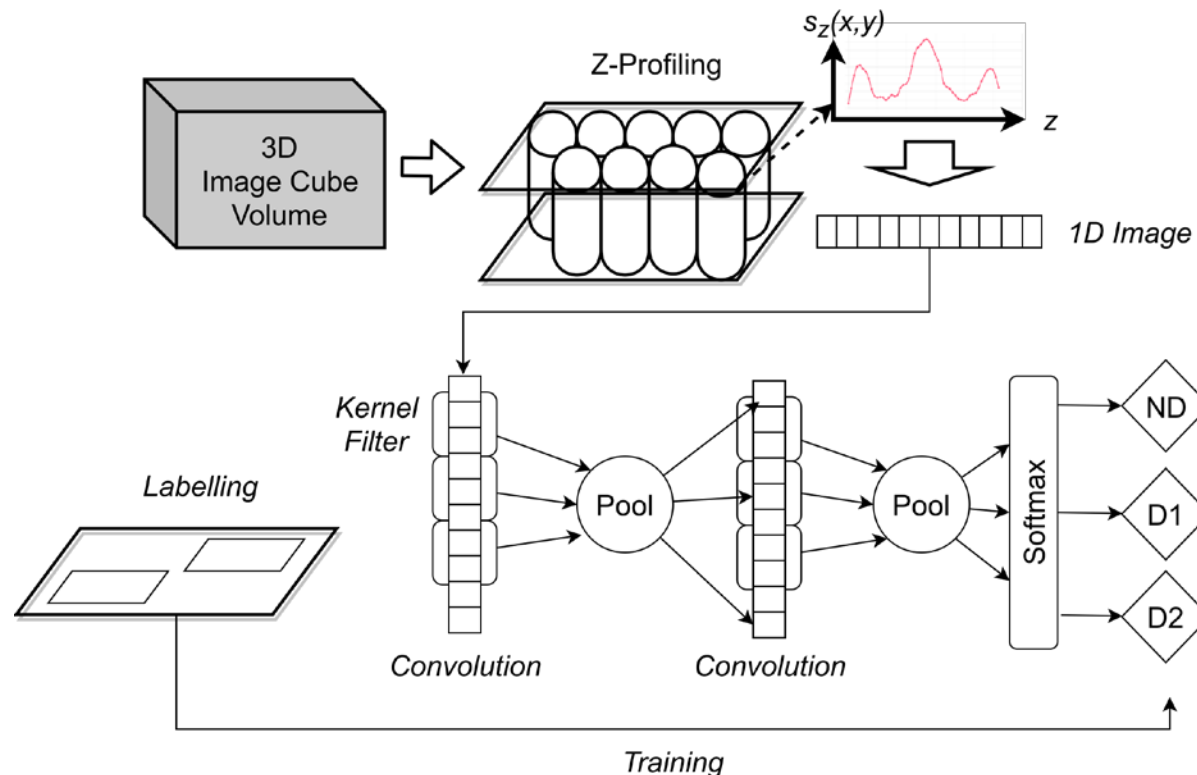

35

Universität Bremen

# ANOMALY DETECTION IN FML CT DATA: POSITIVE TRAIN.

- An anomaly detector is build with a Autoencoder, either using a CNN or a LSTM-ANN
- The AE is trained with z-profile slices without defects or damages (base-line, ground truth data)
- The AE „learns" the z-profile structure of the FML plates and outputs a simplified representation
- If there is a damage/defect, the AE is not able to reconstruct the base-line structure, and an error occurs
STEFAN BOSSE - DETECTION OF HIDDEN DAMAGES IN FIBRE LAMINATES USING LOW-QUALITY TRANSMISSION X-RAY IMAGING, X-RAY DATA AUGMENTATION BY SIMULATION, AND MACHINE LEARNING

36

# ANOMALY DETECTION IN FML CT DATA: NEGATIVE TRAIN.

- A CNN is trained with damaged z-profiles to classify damaged versa undamged z-profile slices

STEFAN BOSSE - DETECTION OF HIDDEN DAMAGES IN FIBRE LAMINATES USING LOW-QUALITY TRANSMISSION X-RAY IMAGING, X-RAY DATA AUGMENTATION BY SIMULATION, AND MACHINE LEARNING

37

Universität Bremen

# ANOMALY DETECTION IN FML CT DATA: SIMULATION

- A typical sample set contains less than 10 different specimens, each with a distint and unique impact damage (and base-line = no damge)

- **Data augmentation by simulation is required to increase feature and data variance!**

- But in contrast to mechanical pore modelling in homogeneous materials, modelling of impact damages in FML is much more complicated reaching high accuracy (wrt. real structures and images)

- Hand-made layer boundary point-marking using image tools

- Functional approximation $\rightarrow$ 3D CAD model $\rightarrow$ X-ray simulation

Universität Bremen

39

# CONCLUSIONS

**Don't trust data-driven modells!**

## Data

- **Single- and Multi-Proj. X-ray Images**
- **Data and feature variance is always limited**!
  - CT scans require high measuring time and produce big data volumes
  - Noise (LowQ)
- Supervised Learning: Hand-made **labelling is a challenge** and inaccurate
  - Relation between image and target features can be very low (contrast)
- CT data can not be used directly for **labelling** due to geometrical distortions (wrt. single projection input data)

## Methods

- 3D CT reconstruction using **Filtered Back Projection** (sine wave filters)
- **Convolutional Neural Networks** for pore and damage feature marling (data-driven negative training) and **LSTM** anomaly detectors (positive training)
- **X-ray simulation** based on Beer-Lambert law and multi-material polygon mesh models
- **Monte Carlo simulation** of materials with defects and damages (openSCAD, **Constructive Solid Geometry**)
- **Measuring devices**: LowQ, MidQ, HighQ

## Results

- **A pure data-driven feature marking model (semantic image pixel classifier) trained with synthetic images only can be applied to real images**
- **The semantic pixel feature marling model is capable to highlight low-contrast features (e.g., hidden pores)**
- **X-ray noise has significant impact on feature prediction results**
- **Accurate and representative training examples (labelling, simulation models) are a pre-requisite for robust data-driven models and a challenge!**
